This communications card adds the Modbus RTU communications interface to the Thyro-Tool Family (thyristor power controller). It can be used for integrating the Thyro-Tool Family into complex systems using the fieldbus. In addition, there are 3 digital electrically isolated inputs on the card (see section 8). These can be accessed via terminal X21.

The Modbus RTU protocol uses a Master/Slave technique to communicate between devices. Meaning, any application that utilizes the Modbus RTU protocol will have a Modbus Master and at least one Modbus Slave. A Modbus Master is typically a host supervisory computer running software that will communicate with one or more Modbus Slave devices.

The main particularity when using RS485 is in the format of the exchanged data. While with RS232 many devices simply use text (ASCII) protocols, with RS485 most devices use the MODBUS protocol. You must therefore know a minimum of MODBUS to interface an RS485 device.

The Modbus communication interface is built around messages. The format of these Modbus messages is independent of the type of physical interface used. On plain old RS232 are the same messages used as on Modbus/TCP over ethernet. This gives the Modbus interface definition a very long lifetime.

A remote terminal unit (RTU) is a microprocessor -controlled electronic device that interfaces objects in the physical world to a distributed control system or SCADA (supervisory control and data acquisition) system by transmitting telemetry data to a master system, and by using messages from the master supervisory system to control connected objects.

Remote terminal unit - Wikipedia

Modbus is a data communications protocol originally published by Modicon (now Schneider Electric) in 1979 for use with its programmable logic controllers (PLCs). Modbus has become a de facto standard communication protocol and is now a commonly available means of connecting industrial electronic devices. Modbus is popular in industrial environments because it is openly published and royalty-free.

Modbus - Wikipedia

Modbus RTU Communication Module contains two-wire terminal for connecting network cable to EIA-485 (formerly RS-485) channel. The module has galvanically isolated EIA-485 interface. The EIA-485 interface is polarity dependent.
